PROCESS

Water/Gas Flow
Water/Gas Pressure
Water Usage
Door Open/Closed
Analog Output Devices
Digital/Contact Closure

ENVIRONMENT

Humidity/Dew Point
Air Quality (PM 2.5)
Noise Level
Water Detection
Carbon Monoxide Sensor
CO2 Meter

The ever changing landscape of condition monitoring makes it difficult to decide which product or system to offer your customers. Once you make that call there is the steep learning curve of how to sell, implement and support the products all the while hoping something better won't come along.

We've been there. Let us save you the trouble with our fully developed system. It starts with training including:

- How to sell product/service
- Guided assistance with sensor selection
- Sensor setup
- Software application setup
- End user training
- Troubleshooting

The software application is browser based allowing for scaled viewing on any computer or mobile device. It is feature packed and includes graphing of current and historical data, equipment utilization tracking, maintenance reminders and much more. Best of all, the application is designed to work with nearly any sensor available now or in the future provided the data can be accessed.

The application continues to improve and add features through feedback from our partners and end users. As a RAMS partner, you will have the opportunity to have changes made to suit your specific needs. The application can be branded as your own with your logo and color scheme.
